

MOSER

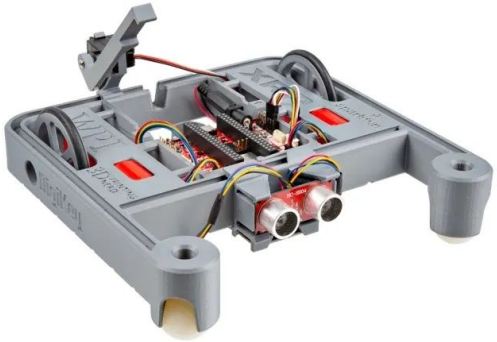

The Problem

High equipment costs, closed-source proprietary designs, and planned obsolescence prevent schools from repairing and maintaining their robotics kits.

Educational institutions face severe financial barriers to adopting and sustaining long-term robotics programs.

Existing Solutions

Experiential Robotics Platform

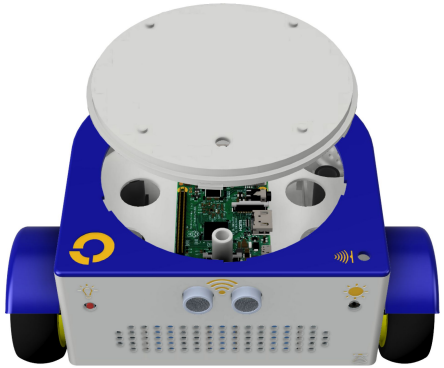

PlatROB

ROBOTONT

FOSSBot

My Solution

A **design system** built for preparing *our future*

Modular
Open
Source
Educational
Robotics

MOSER was built upon the following principles:

1. Must be manufacturable through 3D Printing
2. Open Source
3. Enable and promote the usage of hobby (low-cost) components in an educational aspect
4. *Able to empower students to develop and engineer a robot of their own making.*

MOSER is a Design System, and approaches Open Source Educational Robotics differently then competing open source systems, rather we are competing directly with leading educational robotics products

High equipment costs, closed-source proprietary designs, and planned obsolescence prevent schools from repairing and maintaining their robotics kits.

Educational institutions face severe financial barriers to adopting and sustaining long-term robotics programs.

Next Steps

Develop curriculum aligned with 2026 CSTA PK-12 Standards

Release on August 7th on GitHub
alongside
Website Release at moserdesign.org

Pilot MOSER in local schools

Thank You
